The Architecture of Cinematic AI Video

By Saad Ahmed

Three Styles of Prompting

1

Narrative Prose

- Formula: [Cinematic Setup] + [Subject] + [Action] + [Atmospheric Details].
- Why: I feel lazy.

2

Structured JSON

- Formula: Use categories like "shot", "subject", "scene", "action", and "cinematography".
- Why: It keeps the AI from getting confused between the background and the foreground.

3

Timeline-Based

- Formula: Define 00:00-00:02, 00:02-00:05, etc.
- Why: It forces the AI to follow a sequence (Box opens -> Pieces fly out -> Product assembles).

How can I create these?

Phases

1

The Conceptual Core

2

The Cinematographer’s Rig

3

Material Science & Lighting

4

The Final Polish

The Conceptual Core

Define the "Hero" and the "Hook"

The Hero:

What is the main object? (e.g., A vintage camera).

The Hook:

What is the "impossible" thing happening? (e.g., It dissolves into a swarm of chrome butterflies).

- Use specific brands or materials to lock in the quality (e.g., "Leica-style camera" or "Brushed Obsidian").

The Cinematographer’s Rig

Stop using words like "cool" or "realistic." Use the vocabulary of a film set. Choose your Lens and Movement.

The Lens:

- Macro / 85mm: For detail and textures.
- Anamorphic / Wide: For epic, cinematic sweeps.

The Camera Motion:

- Dolly-In: Smoothly moving toward the subject.
- Lateral Sweep: Moving sideways.
- Fixed Wide: For "Magic Assembly" (where the camera stays still while things build).

The Frame Rate:

- Specify "Slow motion" or "60fps" for fluid physics.

Material Science & Lighting

This tells the AI how light should bounce off surfaces. This is what creates the "8K" look.

Textures:

- Describe the micro-level. (e.g., "glistening condensation," "fine leather grain," "iridescent oil slick").

Lighting Source:

- Use specific professional lights. (e.g., "365nm UV backlight," "Volumetric god rays," "Bioluminescent glow," "Softbox ring light").

The Atmosphere:

- Add "Drifting dust particles" or "Thin morning mist" to give the light something to hit.

Material Science & Lighting

This tells the AI how light should bounce off surfaces. This is what creates the "8K" look.

Textures:

- Describe the micro-level. (e.g., "glistening condensation," "fine leather grain," "iridescent oil slick").

Lighting Source:

- Use specific professional lights. (e.g., "365nm UV backlight," "Volumetric god rays," "Bioluminescent glow," "Softbox ring light").

The Atmosphere:

- Add "Drifting dust particles" or "Thin morning mist" to give the light something to hit.

Checklist

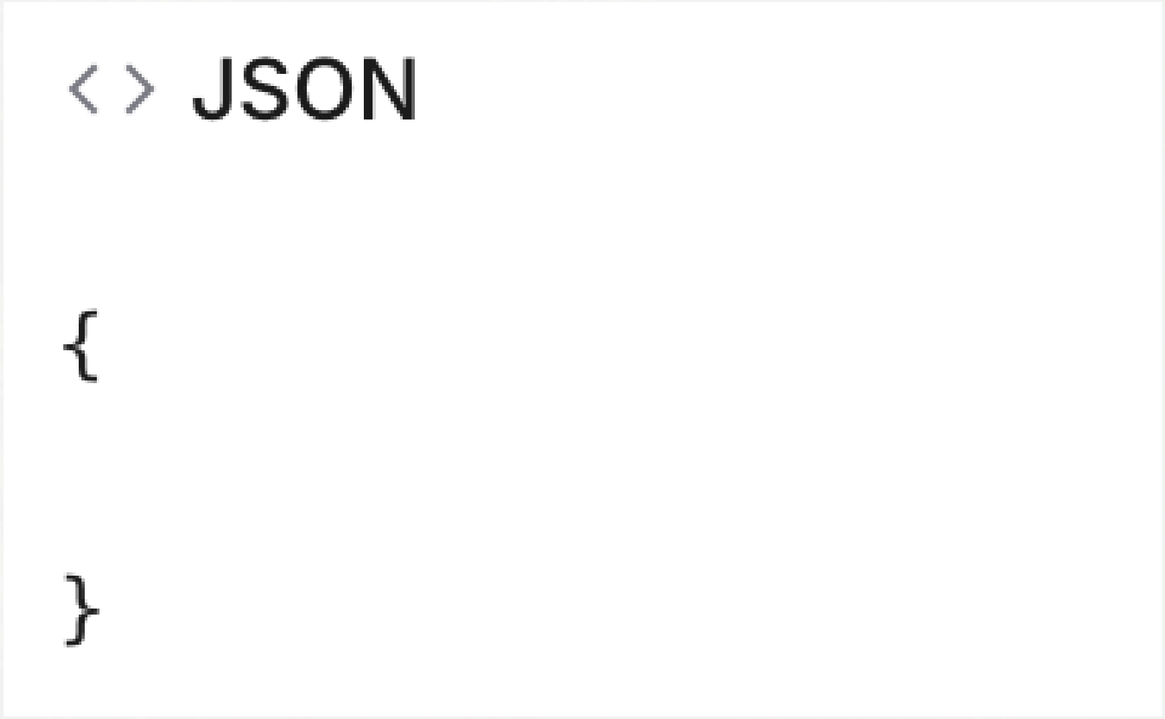

This tells the AI how light should bounce off surfaces. This is what creates the "8K" look.

1. **A specific lens?** (e.g., 85mm macro)
2. **A specific light?** (e.g., Golden hour rim light)
3. **A specific texture?** (e.g., Polished chrome)
4. **A specific motion?** (e.g., Slow-motion breach)
5. **Clean structure?** (Are there quotes and commas if using JSON?)

CSE student na bhai!
JASON kamne?

Step 1: Initialize the "Container"

Every JSON prompt must start and end with curly brackets. This tells the AI: "Everything inside here is part of one single command."

Step 2: Define your Categories (The "Keys")

Think like a film director. What are the most important parts of your scene? Standard categories (Keys) used in high-end prompting are:

- "shot": Camera angle and lens.
- "subject": What is the main focus?
- "scene": Where is it happening?
- "action": What is the motion or transformation?
- "lighting": What is the mood?

```
{
  "shot": "",
  "subject": "",
  "action": "",
  "lighting": ""
}
```

Step 3: Fill in the "Technical Values"

Now, use the professional vocabulary we discussed (Macro, Anamorphic, God Rays, etc.). Put these descriptions inside quotation marks.

- Shot: Describe the lens (e.g., "Macro 85mm") and the motion (e.g., "Slow dolly-in").
- Subject: Describe textures and materials (e.g., "Brushed rose gold watch").

```
{
  "shot": "Extreme macro close-up, 100mm lens, shallow depth of field",
  "subject": "A single drop of liquid mercury on a black glass surface"
}
```

Step 4: Craft the "Action Sequence" (The Physics)

This is where the magic happens. In the "action" or "motion" key, describe how things change over time. Use words that describe force and fluidity.

```
"action": "The mercury drop vibrates rapidly, then sprouts sharp, crystalline metallic spikes that grow and interlock to form a complex geometric crown."
```

Step 5: Leveling Up

To get even more control, you can put a "list" inside a "category." This is called nesting. You use curly brackets { } inside your main brackets.

```
"lighting_setup": {
    "primary": "Single dramatic top-down spotlight",
    "secondary": "Deep blue rim lighting on the metallic edges",
    "atmospheric": "Subtle drifting smoke catching the light"
}
```

Why JASON?

When the AI reads this, it sees a database of instructions. It doesn't have to guess if the "blue" refers to the "light" or the "subject"—because you've placed them in separate boxes. This leads to the ultra-high-quality results seen in the Maserati, Adidas, and Louis Vuitton examples.

THE BRACKETS

1. Curly Brackets { }

Name: Objects / Containers

The Rule: Use these to group related categories together.

- **The Main Container:** Every prompt starts with { and ends with }. It tells the AI: "Everything inside these two marks belongs to one single video."
- **The "Nested" Container:** You use them inside the main prompt to create a sub-section.

Example: If you want to describe a Camera, you use curly brackets to keep the "Lens" and the "Movement" in one "box."

```
"camera": {
   "lens": "85mm",
   "movement": "Slow pan"
}
```

2. Square Brackets [ ]

Name: Arrays / Lists

The Rule: Use these when you have multiple items for a single category.

- **The Shopping List:** If a category has more than one value, you put them in square brackets separated by commas**.**
- **Multiple Elements:** Use these for things like a list of props in a room or a list of colors.

```
"props": ["IKEA box", "yellow throw blanket", "bedside lamp", "potted plant"]
```

3. Quotation Marks " "

Name: Strings / Labels

The Rule: Use these for every piece of text.

- **The Key:** The category name must be in quotes (e.g., "lighting").
- **The Value:** The description must be in quotes (e.g., "neon blue").
- **Why?** Without quotes, the AI thinks you are writing a mathematical command or a piece of logic. Quotes tell the AI: "This is a descriptive word."

Competitive Advantage

Symbol	Name	Purpose	Analogy
{ }	Curly Brackets	Organization. Groups different types of info.	A Room (The "Camera Room").
[ ]	Square Brackets	Collection. A list of similar things.	A Tray of items (The "Props Tray").
" "	Quotes	Definition. Tells the AI "This is a word."	A Label on a box.

Pro-Tip: The "Comma" Rule

- Use a comma after every } or] or " IF there is another line coming after it.
- Do NOT use a comma on the very last line before the final }.

- { } = "WIRE"
- [ ] = "SAAD BHAI."
- " " = “SAAD BHAI ER DARI”

The End

THANK YOU FOR LISTENING
